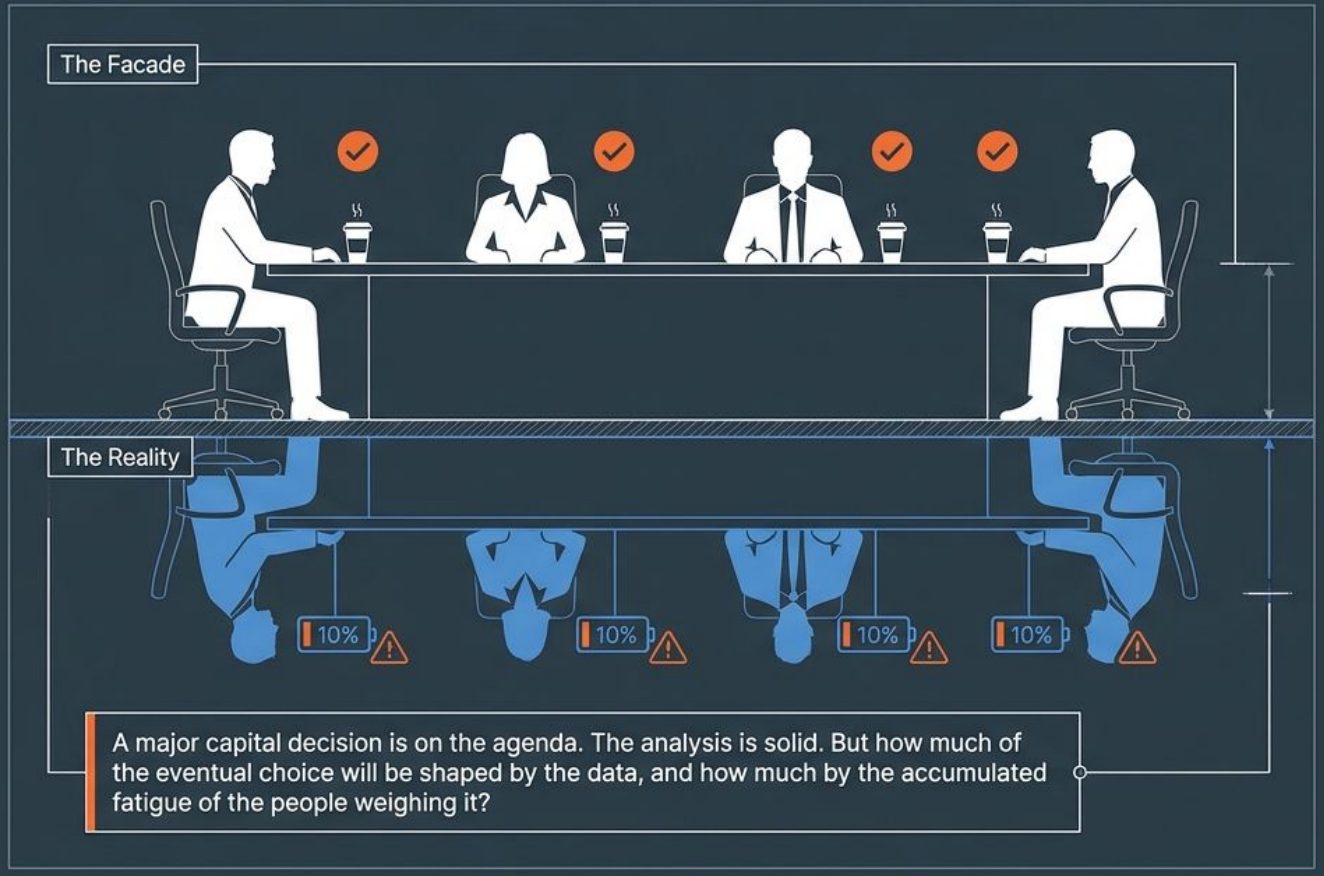
The Tired Room

Hidden Sleep Debt, Performed Alertness, and the Operational Case for Rested Judgment

Based on the research of Jonathan H. Westover, PhD
Nexus Institute for Work and AI

Human Capital Innovations

The Facade of Performed Alertness



A major capital decision is on the agenda. The analysis is solid. But how much of the eventual choice will be shaped by the data, and how much by the accumulated fatigue of the people weighing it?

The 2026 Executive Reality

89%

of leaders have made critical business decisions on 6 hours of sleep or less.

79%

actively conceal their tiredness from colleagues or senior leaders.

60%

operate in cultures where running on little sleep is viewed as a sign of commitment.

Human Capital Innovations

The Lexicon of Operational Capacity

Sleep Debt

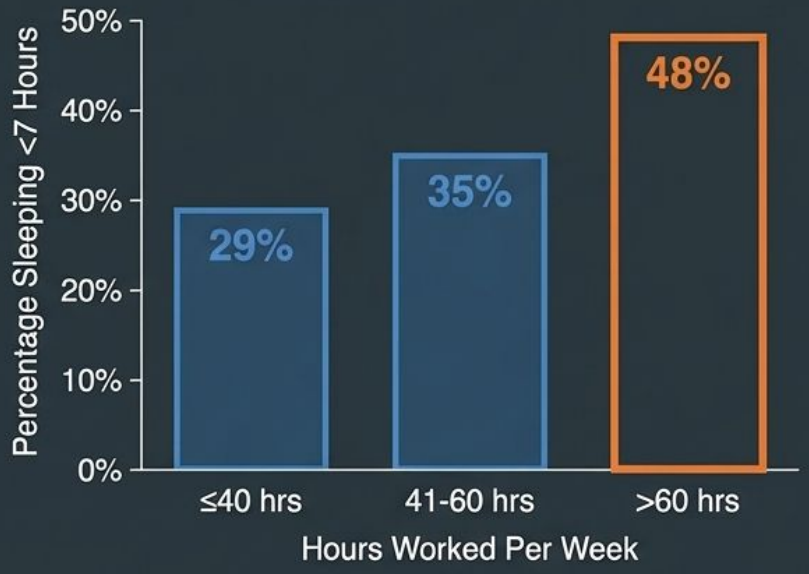
Accumulates quietly. A person sleeping **six hours** a night may feel adapted, yet objective performance continues to decline.

Performed Alertness

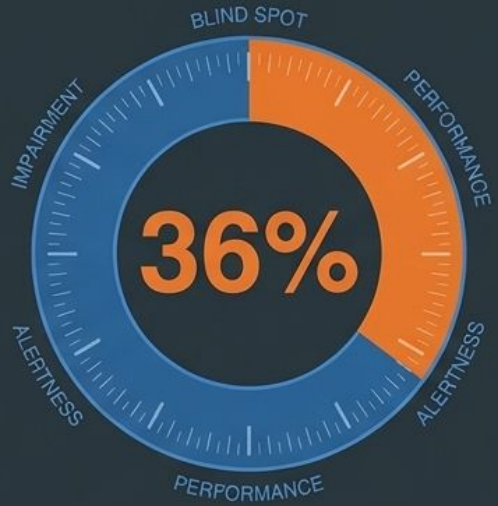
The deliberate concealment of fatigue in **profe**ssional settings—an organizational phenomenon driven by perceived norms about commitment.

Human Capital Innovations

The Workload Dose-Response and the Assessment Gap



Nearly half of employees working >60-hour weeks fall short of biological baselines. Sleep loss concentrates in the C-suite, shift workers, and junior professionals.



The Self-Assessment Gap

36% of the most chronically under-slept leaders believe sleep loss has little or no effect on how they lead.

Insight: As sleep debt accumulates, self-assessment of impairment becomes highly unreliable.

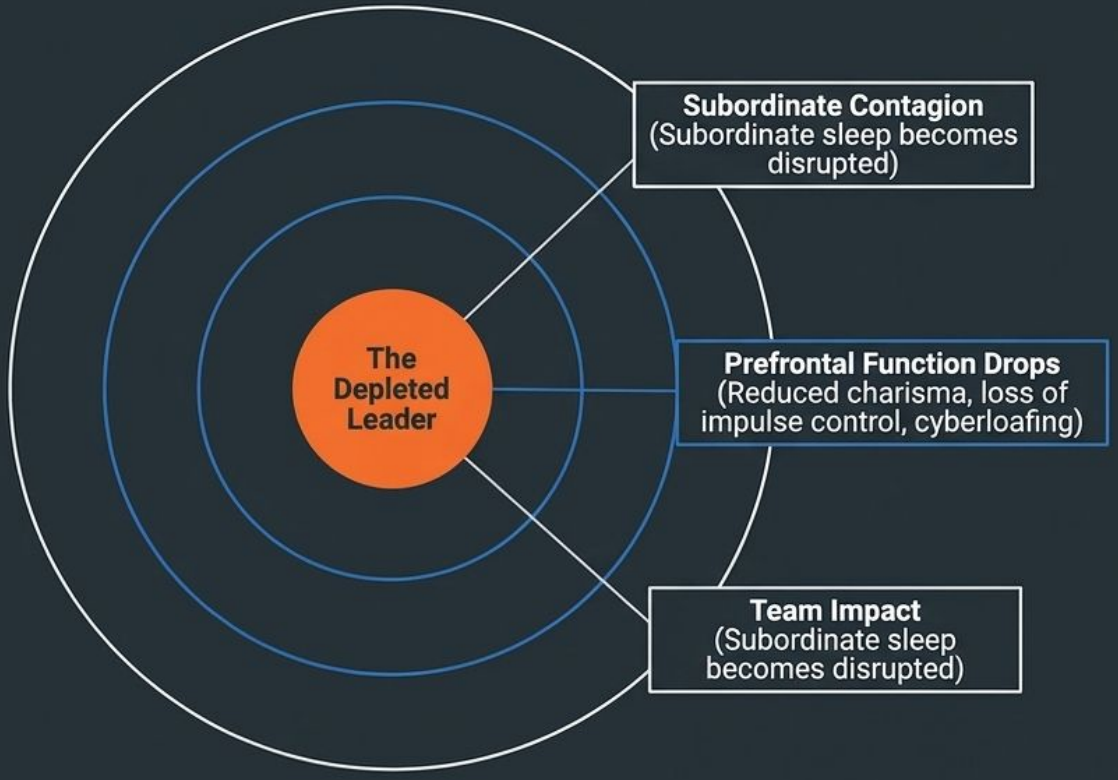
Human Capital Innovations

The Invisible Tax on Cognition and Safety

Medical Errors	Workplace Injury	Economic Drag
First-year residents made 36% more serious errors and 5.6x more diagnostic errors on 30-hour extended shifts.	Mining injuries spiked 68% on the Monday following the 40-minute sleep loss of Daylight Saving Time.	An estimated $411 Billion (2.28% of GDP) is lost annually in the U.S. economy to insufficient sleep and absenteeism.

Human Capital Innovations

The Blast Radius of Leader Fatigue



Core Insight

Fatigue travels through reporting lines. On days following a leader's poor sleep, their self-control drops, triggering abusive supervision. This behavior actively degrades the sleep quality of their direct reports the following night.

Key Takeaway: A tired manager is an organizational contagion risk.

Human Capital Innovations

The Paradigm Shift: From Wellness to Work Design

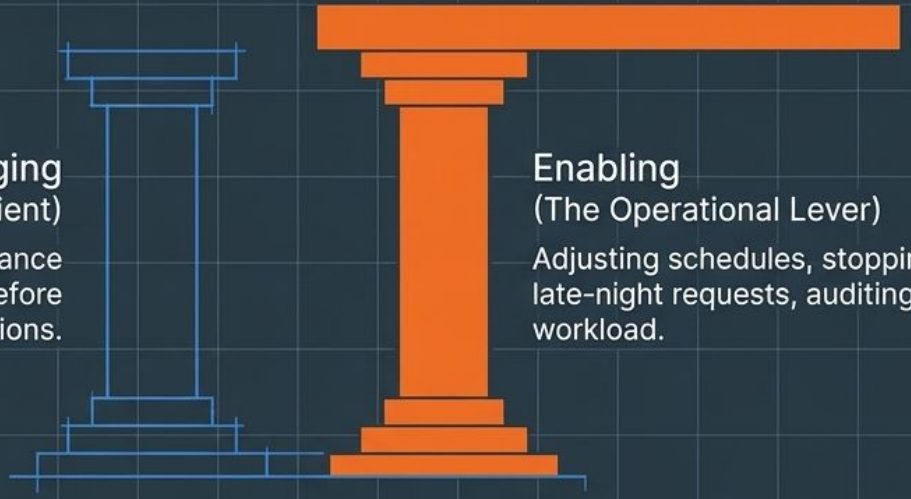
	The Legacy View	The Operational View
Core Framing	Sleep is a personal lifestyle and wellness issue.	Sleep is a critical performance input and safety variable.
The Primary Fix	Solved via education, willpower, and sleep hygiene newsletters.	Solved via schedule design, staffing models, and biological guardrails.
Measurement	Monitored via intrusive personal wearables or ignored entirely.	Monitored via system metrics (hours, turnarounds, exceptions).
End Result	A culture of Performed Alertness.	Sustainable organizational capability and Rested Judgment.

Human Capital Innovations

Response 1: Sleep Leadership as a Competency

Encouraging
(Necessary but Insufficient)

Discussing sleep as a performance resource, modeling rest before major decisions.



Enabling
(The Operational Lever)

Adjusting schedules, stopping late-night requests, auditing workload.

U.S. Army Doctrine	Aetna's Limits
Trials prove that training leaders to change conditions for others works better than educating individuals about sleep directly.	Paying employees for sleep raises awareness, but incentives cannot compensate for workloads that make 7 hours mathematically impossible.

Ask about workload, don't monitor bedrooms.

Human Capital Innovations

Response 2: Guardrails and Recovery Windows

The Strategy

Implementing weekly hours thresholds with real-time visibility and protecting defined off-periods.

Infrastructure over Willpower

Volkswagen configured servers to block email delivery to employee devices 30 minutes after shifts ended. Infrastructure removes the burden of self-restraint.

The Pitfall of Paper Limits

An hours cap routinely waived by senior executives for "live deals" is worse than no policy—it teaches employees the stated rule is a fiction.

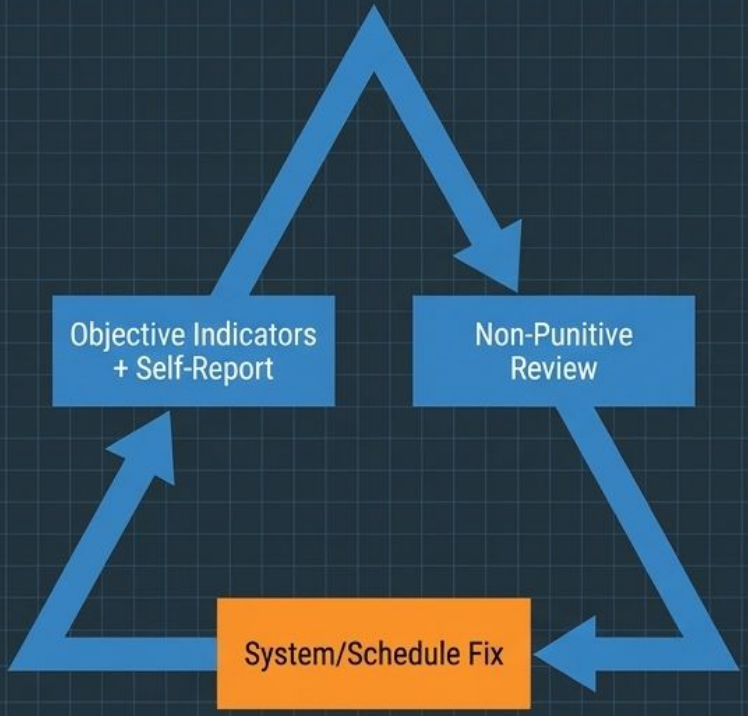
Human Capital Innovations

Response 3: Designing Around Human Biology

The Strategy	Evidence & Reality
Guaranteeing minimum rest between shifts, protecting sleep before night work, and limiting consecutive extended shifts.	↳ **ThyssenKrupp:** Assigning steelworkers to shifts based on chronotype reduced social jetlag by an hour without reducing operational output. ↳ **FAA Reality:** Mandating 10-12 hours of rest between shifts works in theory, but without adequate staffing, biological gaps are simply filled with mandatory overtime.

Human Capital Innovations

Response 4: Non-Punitive Fatigue Risk Management



The European Aviation Warning

A 2026 survey of 7,200 airline pilots revealed that over 75% experienced microsleeps while operating an aircraft. Yet, only 11.9% trusted their airline's fatigue reporting system.

Fear of discipline blinded the organizations to severe systemic risk.

The Operational Fix

Treat fatigue as a system diagnostic, not a character flaw.

1. Provide the protected right to decline duty extensions.
2. Aggregate reports to identify problematic routes, rosters, or managers.
3. Treat the absence of reports in high-demand units as a failure of trust, not an absence of fatigue.

Human Capital Innovations

Response 5: Control Over Work Time

THE TRIAL

A randomized controlled trial at a Fortune 500 IT firm (Olson et al.). Teams redesigned work practices to increase schedule control and focus evaluation entirely on results rather than visible presence.

THE ROI OF AUTONOMY

Employees in the intervention group objectively gained nearly an hour of sleep per week, with improvements sustained at 18 months.

FLEXIBILITY WITHOUT WORKLOAD REDUCTION IS A TRAP.

Giving people control over their time simply spreads exhaustion across more of the day if the raw volume of work remains unchanged.

Human Capital Innovations

The Intervention Toolkit

Strategy	Key Mechanism	The Evidence	The Common Pitfall
Sleep Leadership	Focus on enabling (schedules) over encouraging	U.S. Army Trials	Treating it as a wellness message rather than management practice.
Guardrails on Hours	Server-side delays, real-time tracking	Volkswagen, Medicine	“Paper limits” with routine executive waivers.
Biological Design	Minimum rest gaps, chronotype matching	ThyssenKrupp, FAA	Increasing rest rules without addressing staffing deficits.
Fatigue Risk Mgmt	Non-punitive reporting, right of refusal	European Airlines	Performative systems where reporting is viewed as weakness.
Work Time Control	Team-level redesign, results-based evaluation	Fortune 500 IT Firm	Flexibility without reducing the underlying workload.

Human Capital Innovations

Measuring Fatigue as an Operating Risk

Threshold Breaches

Tracking % of workforce >60 hours/week

Short Turnarounds

Frequency of <10 hours between shifts

Exception Approvals

Volume of executive waivers for live deals/overtime

The Philosophy

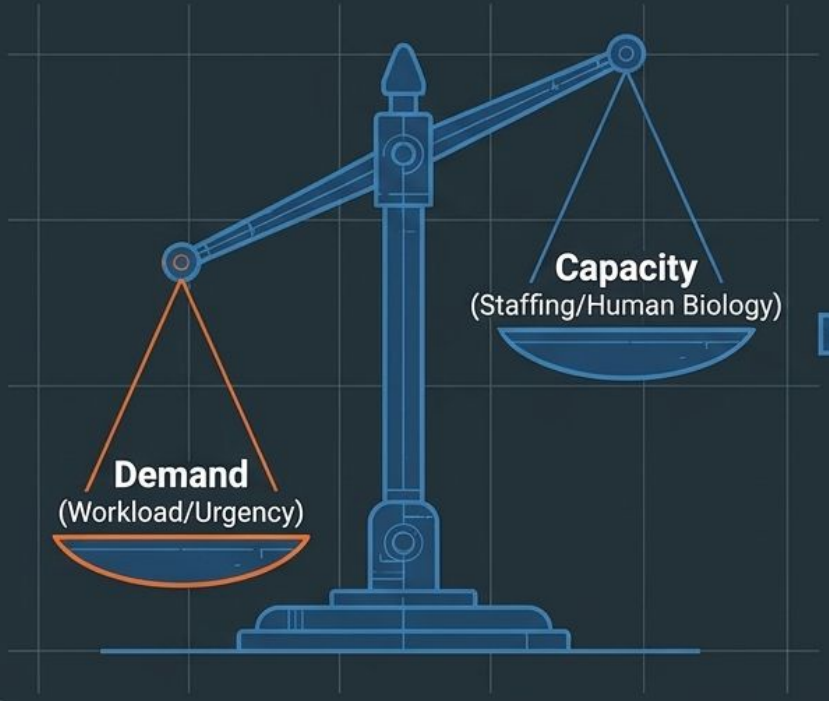
What gets measured gets managed. You cannot engineer rested judgment if you only review hours data for payroll costs.

The Application

Connect these fatigue indicators directly to unit performance, injury clusters, and team engagement scores. When units show high error rates or sudden turnover, pull the telemetry on the leader's schedule first.

Human Capital Innovations

The Ultimate Choice: Staffing for Rest



Add Capacity:
Hire, cross-train, or automate.

Reduce Demand:
Say no to marginal work or decline lower-value deals.

Explicitly Accept Fatigue Risk:
Allow compromised judgment and safety risk to become the invisible default.

Naming this trilemma explicitly is the ultimate act of sleep leadership.
